
QConnect

Your Pi — the one-page version

Plug in, get online, who to call

Version 1.0 · 09/16/2026

Keep this with the box. The full guide has more detail, but this page is usually all you need.

1. Plug it in

Put the Pi somewhere dry with a little air around it. If you are using a network cable, plug that in **first**, then the power. Wait two minutes.

2. Get it online — pick one

- **Network cable (easiest).** Plug it in. Nothing else to do.
- **Wi-Fi.** On a phone or laptop, join the network called **QConnect-Setup**. A page opens by itself; if it doesn't, open a browser and type **10.0.0.1**. Pick your Wi-Fi, type the password, press Save. The Pi restarts and joins.
- **Mobile SIM.** Already set up. Just power it on and give it ten minutes.

3. How to tell it worked

A steady light and a blinking light. Nothing else has to happen on your side — we can see it arrive on our dashboard within a couple of minutes.

4. Everyday use

Leave it plugged in and leave it alone. It updates itself. If you need to move it, pull the power, move it, plug it back in.

5. The one rule

Never pull out the little memory card while the Pi is powered on, and never erase or rewrite it — even if another device asks you to.

6. Something not right?

What you see	Try this
No lights	Push the plug fully in at both ends; try another socket.
Red light only	Power off, push the memory card fully in, power back on.
No QConnect-Setup network	Power off, wait ten seconds, power on, wait two minutes.
Was working, now offline	Did the Wi-Fi password change? Redo step 2. On a SIM unit, move it near a window.

Still stuck? Call us and read out the name on the sticker.
